The last couple of decades have witnessed an increasing interaction between chefs and scientists, fueling new trends in both cooking and in the sciences. In June 2018 an international, two-day topical symposium organized in Copenhagen brought together chefs, scientists, communicators, students, and gastronomical entrepreneurs to discuss in an informal and creative atmosphere matters of mutual interest with the aim of further cross-fertilization and developing new ideas for future and collaborative work. A particular emphasis was on communication and public outreach. The symposium also included workshops with gastronomic and gastrophysical demonstrations and experimentation.

A survey showed that the about 100 participants came both from gastronomy and science, with 35% self-identifying as scientists or science researchers, 8% as chefs, and 5% as both (Fig. 1). Among the participants where also educators (16%), students (12%), communicators/journalists (12%), and gastronomical entrepreneurs or persons from gastronomical businesses (7%). Survey responders were allowed to choose more than one identity and this is reflected in the survey results.

The goal of the symposium was to bring together professionals from two very different fields — science and gastronomy — as well as those working at the intersection of both. In doing so we hoped to spark new ideas for teaching and research. Moreover, we hoped that the symposium might also inspire novel collaborations in the field, a field which by its very definition relies on cross-talk between disciplines.

The degree to which we achieved these goals is not straightforward to quantify, but in order to get a sense we summarized our goals in short statements. Attendees were then asked to rate the degree to which they agreed with the statements in a survey. The survey was made available during the first day, but attendees were encouraged not to complete it until the end of the last day.

The majority of respondents either “strongly agreed” or “agreed” with most of the statements (Fig. 2). A large majority, 86%, agreed or strongly agreed that they had “interacted with professionals in a different field” from their own. In addition, most respondents agreed or strongly agreed that they had met people or attended sessions that “influenced their thinking” (87%) or “helped them develop ideas for their future work” (79%). Similarly, many respondents stated having met people they would either stay in touch with (70%), or may collaborate with (68%), in the future. A remarkable 86% of respondents stated that they had gained an appreciation for how food and taste can enhance public understanding of science.

We were curious which ideas from the symposium stood out to participants as being especially important. To get a sense, we asked survey responders to list the three most important ideas that they had either developed themselves during the symposium, or heard about from others.

Sometimes survey questions like these highlight that a small number of ideas have resonated with many people, with these ideas being repeated over and over in their answers. That was not the case here. Instead, the three most important ideas reported by survey takers varied widely, only rarely being repeated by a small number of respondents. Perhaps this is to be expected since professionals of diverse backgrounds are likely to differ in their opinion of what they find “important”. The answers ranged from topics like “squid” and “jelly-fish” to “holistic cuisine” and “arts and aesthetics in meals” — all having appeared in presentations. Other important ideas were the “role of the chef”, “how science and cooking can thrive together”, as well as various comments on how food/cooking can be used as teaching tools.

When coaxed for specifics in how they might implement what they learned at the symposium in their work, about a fifth of respondents commented that they would use it in their teaching, with another fifth stating they would use it in their research. About a third reported some aspect of collaborations, such as “explore new collaborations, deepen or refresh existing ones” or “initiating collaborations and writing common grant applications”. Many also seemed intrigued by the interdisciplinary aspects raised in the symposium, stating things like being “encouraged” in “approaching people from different disciplines” for “multidisciplinary collaborations”. A small number said that it was too early to say how they might implement what they learned at the symposium, reflecting what seemed to be a common notion that collaborations often are not immediate, but may develop over time.

The present special issue of International Journal of Gastronomy and Food Science contains a collection of sixteen papers under the heading *Chefs meet scientists: GASTRO-SCIENCE-CHEF 2018*, which were submitted subsequent to the symposium, mostly from attending speakers. The collection of papers mirrors some of the wide-ranging contents of the symposium, including both original research papers, reviews, short communications, and opinion papers.

The sixteen papers cover diverse topics like soft-matter physics and gastronomy of jelly fish (Thorborg and Vilgis, 2018); the gastrophysics of squid (Faxholm et al., 2018); science education and public understanding of science (Sørensen and Mouritsen, 2018), culinary practitioners' views of interaction between gastronomy and research (Fooladi et al., 2018); dining experiences at the inter-section of cooking, research, and communication (Lloréns, 2018); terminological conundrums related to science and gastronomy (Hedegaard, 2018); phycogastronomy (Mouritsen et al., 2018); taste learning in children (Olsen, 2018); teaching science to chefs (Christensen and Edwards-Stuart, 2018); the role of the chef in the 21st century (McBride and Flore, 2018); the holistic cuisine (Brønnum and Munk, 2018); gastronomic research in tempeto (Guixer, 2018); and frames for collaboration between chefs and scientists (Frøst, 2018).
